

teleskopy.pl

Celestron C70 Mini MAK is a compact telescope in the Maksutov system (a meniscus and mirror system) with an aperture of 70 mm and a variable zoom (zoom) from 25 to 75 times. It is a valued telescope for bird and nature observation, great for observing aircraft and shooting sports for observing bullet holes (25, 50 and 100 m). A good astronomical traveler scope (a travel telescope), allowing you to perform the first observations of craters on the moon, moons of Jupiter, the ring of Saturn, phases of internal planets, etc. The set includes a very good class table stand, a soft telescope cover and an adapter that allows the use of astronomical goggles in a 1.25" frame and accessories for astrophotography

Technical parameters

- Zoom: smoothly variable, 25-75 times
- Lens diameter: 70 mm
- Optical system: Maksutow-Cassegrain (MAK)
- Focal length of the lens: 750 mm
- Anti-reflective layers: MC
- Field of view: 1.3° - 0.7°
- Minimum distance of observation: 6 m
- Retracting the output pupil: 22 mm (at 25x magnification)
- Length of the tube: 28 cm
- Weight: 910 g
