Camrock TS53 is a professional aluminum-magnesium tripod for demanding photographers. The robust design allows it to be used in difficult conditions. The quality of the workmanship and the materials used at the highest level guarantee above-average strength and stability. It is perfectly suited for use with binoculars weighing up to 3 kg, practically all observing telescopes, heavier digital cameras, SLRs and cameras. The set includes a ball head, allowing precise positioning of the camera in the desired position. The double column allows the head to be mounted in reverse (downwards), making it easier to photographing small objects. It is possible to use two heads at once! Four-sectional legs have strong braces and a quick-release system. The tripod is also equipped with a spirit level. The standard 3/8 inch thread allows you to mount any head on a tripod. The set includes a Camrock ball head with a 1/4 inch thread (standard tripod thread) and a comfortable shoulder strap. Technical parameters

- Length of the folded tripod (maximum working): 153 cm
- Length of the folded tripod (minimum working distance): 57 cm
- Tripod length in the transport position: 58 cm
- Distance between legs (max): 85 cm
