

The long-range IR illuminator allows to increase the observation range with night vision in the active mode (with the illumination switched on) to 400-500 meters. The source of light: an infrared diode. Output power of beams: 80mW. It has an adjustable frame with an optic that allows you to choose the optimal angle of the illuminator beam and control the beam power. Mounting: on the body of the Night Spirit telescope, parallel to the axis of the night vision device. Works with the following night vision devices: â€¢ Night Spirit (2I and 2IA) â€¢ Night Raven (all generations)
