

The NLV series of glasses are made of high-quality low-dispersion optical elements that ensure the highest quality of images obtained combined with a very high comfort of observation. The lanthanum optics with very good MC layers provide bright, contrasting and sharp images with a large amount of detail. Thanks to a large distance of 20 mm output tube and an adjustable eyecup, there is no need to bring the eye closer to the eyepiece to see a full and sharp image in the whole field of view, which is especially important for those wearing glasses and during winter observations because the optical elements of the eyepiece are less prone to fog. ∅ Focal length: 9 mm ∅ Field of view: 50 ° ∅ Distance of the exit pupil: 20 mm ∅ Diameter of binding: 1.25 inches ∅ Anti-reflective layers: MC ∅ Weight: 158 g Warranty 2 years
