TS 70 binoculars equipped with semi-APO lenses for astronomical and natural observation. Thanks to the possibility of changing the glasses, the magnification is variable. The set includes a pair of eyepieces enabling a magnification of 16x. Using other sets of glasses (1.25 inch standard) you can even use magnification of 80x. The eyepieces included in the kit are filter threads that allow you to use filters to increase the contrast of images or increase the number of perceivable details. An important feature, especially facilitating astronomical observations in the vicinity of the zenith, is fixing the glasses at 45 ° in relation to the optical line of the binoculars. The glasses are fixed with the help of clamping rings, thanks to which axially and secure fitting of the glasses (luminaire standard of 1.25 inches) are ensured. Excellent images are provided by two lenses, semi-APO triplets with an aperture of 70 mm and large prisms made of BAK-4 glass. All air-to-glass surfaces are covered with FMC layers, while the interior is filled with nitrogen. Retractable deflectors protect the lenses against fogging. The binoculars are equipped with a convenient carry handle. After removing the handle, attach the finder in the standard foot. In the bottom part there is a socket with a 1/4 inch thread, which allows you to attach the binoculars on any photo tripod. However, observations made with a special forklift installation (mounting sockets on the sides of the binoculars) will definitely be more convenient. Compact dimensions (31 x 24 x 13.3), relatively low weight (3.5 kg) and the instrument case and accessories included in the set make the TS APO 70 mm a very mobile observation equipment. The set includes: € TS APO 70 mm binoculars € focal length of lenses: 400
