

---

A long-awaited set that allows you to transform a popular Dobson into a telescope with the GOTO system. The heart of the set is the SynScan driver known from the HEQ5 and EQ6 assemblies, this driver allows you to find any of over 30,000 objects in the database. The objects are tracked, which makes the observations easier with the telescope on the box assembly. The set contains all the elements needed for self-assembly (in principle, it is a complete assembly of the telescope). These include special holders for the optical tube, motors in housings, bolts, needed cabling and the GoTo controller itself. The presented version is intended for Synta SKDOB 10 telescopes (basic telescope) and DOB 10 Flex Tube (Dobson telescope).
