Delta Optical Discovery 40 is a practical and easy-to-use stereo microscope, designed for viewing in reflected light and passing light. It offers 20x and 40x magnification in the set, and with the optional 20x eyepieces we get a maximum magnification of 80x. The Delta Optical Discovery 40 stereoscopic microscope is the best gift for a person who begins a great adventure with nature. You do not need to be able to prepare preparations as it is in biological microscopes. It is enough to bring exhibits from the walk (if they are not under protection) and we can start observations. We immerse ourselves in a three-dimensional micro-world of insects, plants and aquatic organisms. We will look closely at paleontological specimens on each side, check the quality of minerals and look at what is hidden in amber. The stereoscopic microscopes allow observation in three dimensions, we can assess the depth, we recognize what is closer to us and what next. We can use good and inexpensive microscope cameras or special connectors and SLR cameras for photographic and film recording of microscopic images. For a perfectly sharp photographic image, the Helicon Focus software will be useful, thanks to which we collect the photographs obtained from various depths of focus in one piece. Technical parameters

- 30.5 mm 10x 2 lenses
- 2x and 4x lenses
- magnification with standard equipment: 20x, 40x
- lighting the preparation using the lamp in passing or reflected light
- flat table with clamps for fixing the preparation
- replaceable matte and black and white tiles
- upper and lower LED lighting

Warranty 2 years
