

teleskopy.pl

A set of three RGB filters in the Deep-Sky version, in a 1.25" frame. Recognized as the best on the market. Characteristics – transmission up to 95% – ultra sharp, point star images – high contrast – optimized spectral windows to obtain the largest number of photon counts on the matrix – diffraction-limited accuracy – parhocal with other Astronomic filters – resistant to moisture, scratch, does not age – Soda lines are not passed Tip Under conditions of light pollution, the manufacturer suggests using a CLS-CCD filter instead of L (luminance). Thanks to this, the quality of the material increases significantly.
