Large binoculars offering variable magnification in the range of 10 to 30x. Model from the basic, economic Falcon line of the American company Bushnell. A proposal for people who care about versatility. Thanks to the variable magnification, you can decide whether a larger field of view or higher image detail is more important at the moment. A good choice when looking for binoculars, which at an affordable price will give us much joy during holidays or in the stands of the stadium. Thanks to a large range of magnifications, with proper stabilization it can also be successfully used for observing aircraft and the night sky. A great gift for a junior! Thanks to the prisms in the porro system, the binoculars provide a more stereoscopic three-dimensional image than the more compact roof models. Satisfactory brightness, even at maximum magnification, provides lenses with a relatively large diameter of 50 mm and anti-reflective coatings on all lenses (Fully Coated). Change the magnification using the convenient handle on the right eyepiece. The focus is adjusted using the central knob on the bridge between the binocular tubes. The optical system of the binoculars is protected by a light, handy casing covered with rubber, which absorbs random impacts and falls from small heights. The set includes a strap for carrying binoculars around the neck. Technical parameters â€¢ magnification: 10-30x â€¢ Lens diameter: 50 mm â€¢ field of view / 1000 m: 50 m @ 10x; 33 m @ 30x â€¢ Excavation point (mm): from 5 to 1.5 â€¢ prism system: porro â€¢ glass: coated all surfaces of the lenses â€¢ focus adjustment: central + tuning in the eyepiece for the eye defect â€¢ weight: 680 g â€¢ producer: Bushnell, USA
