

The iridescent Levenhuk FS10 strap designed for binoculars is an indispensable accessory for those who carry out observations near water. If the binoculars accidentally fall into a river or lake, the belt will not let it sink - it will float on the surface of the water, indicating the position of the binoculars. This strip made of material allows the observer to wear binoculars on his shoulder. It is long, wide and comfortable, which makes it particularly suitable for long hikes. The characteristic feature of the belt is its unsinkable - after being thrown into the water, it floats on the surface. Therefore, the strap attached to the optical instrument will not allow it to sink or float away. Technical parameters - total length: 110 cm - width: 4.5 cm
