

The O III 2" filter has the best effects of all nebulae filters, especially under very light-polluted skies. Ideally suited for CCD photography due to its unsurpassed contrast. No picture degradation can be seen even at the highest magnifications. It has the same ultra-hard, extremely durable and vacuum coated dielectric coatings as those used in the UHC-S filter. The Baader O-III filter effectively blocks the entire visual spectrum except for the O-III spectral line, eliminating annoying colored halo around stars that often appear in O-III filters produced with less advanced coating technologies. Technical parameters - \varnothing diameter of the housing: 2" - \varnothing transmission: 92%
